

NEIGHBOURS HUB

5-Member Live Presentation Scripts

Spoken Dialogues in Roman Urdu

ABOUT THIS PRESENTATION SCRIPT

This document contains a structured, action-by-action presentation script for a 5-member team demoing the Neighbours Hub platform to course evaluators and peers.

To ensure a natural and engaging flow during live delivery, all spoken scripts and dialogues are written in professional Roman Urdu, while all technical keywords (NestJS, React, PostgreSQL) and step-by-step user interface navigation actions remain in English.

Please follow the exact UI actions alongside the dialogues for a seamless demo.

ROLES DIVISION & SUMMARY

Presenter 1: Intro, Tech Stack, Noticeboard & Switcher Introduction

Presenter 2: Resident Search, AI Smart Matcher, AI Trust Profile & Bookings

Presenter 3: Provider Profile Dashboard, statistics metrics & AI Listing Enhancer

Presenter 4: WebSocket Messaging, Chat Bypass Security Auditing & Work Orders

Presenter 5: Dispute Center, AI Mediator, Admin Console & Conclusion

Neighbours Hub Development Team - Presentation Script Guide

SCREEN ACTIONS & LIVE NAVIGATION (ENGLISH):

1. Open your browser and navigate to <http://localhost:5173/>.
2. Start on the Login Page. Point to the floating 'Demo Role Switcher' widget on the bottom right.
3. Click the Switcher and select 'Jane Doe (Resident)'.
4. Click 'Noticeboard' in the navigation bar.
5. Point to the 'Summer Festival' post (which is pinned at the top with a pushpin icon).
6. Point to the comments section below the post showing Hassan Syed and Jane Doe chatting.
7. Click 'Write a comment...' and type: 'Can't wait to see the booths!' then click the send icon.

SPOKEN SCRIPT & DIALOGUE (ROMAN URDU):

"Assalam-o-Alaikum, members of the jury aur dosto. Aaj humari group Neighbours Hub ka live demo present karne ja rahi hai, jo ke aik AI-powered hyperlocal services marketplace hai. Is platform ka maqsad local residents ko un ke qareeb ke trusted aur verified service providers se connect karna hai.

Technical architecture ki baat karein to hum ne frontend ke liye React (TypeScript) aur Material-UI use kiya hai, backend ke liye NestJS use kiya hai, aur database mapping ke liye Prisma ORM ke sath PostgreSQL ka istemal kiya hai. Real-time updates ke liye hum ne Socket.io integration ki hai aur advanced AI features ke liye OpenAI GPT-4o API use kiya hai.

Apni presentation ko smoothly dikhane ke liye, hum ne screen ke bottom right par aik floating Demo Role Switcher widget banaya hai. Is se hum bina log out kiye instantly different accounts (Resident, Provider, Moderator, aur Admin) ke darmiyan switch kar sakte hain.

Main abhi Jane Doe (Resident) ke account se logged in hoon. Sab se pehle, hum Community Noticeboard dekhte hain, jahan moderators pinned announcements post karte hain. Pinned Summer Festival post ke neeche residents aur providers real-time comments kar rahe hain. Main yahan aik comment post kar ke dikhati hoon.

Ab main presentation [Presenter 2's Name] ke hawale karta hoon, jo aap ko resident ka booking process aur AI Smart Matchmaking ka detail demo dein ge. Shukriya."

TECHNICAL KEYWORDS & SLIDES FOCUS:

- Database model utilizes separate tables for User, ProviderProfile, Booking, Dispute, Review, Announcement, and Comment.
- Floating Demo Switcher simulates JWT token exchanges in the background.

SCREEN ACTIONS & LIVE NAVIGATION (ENGLISH):

1. Stay logged in as Jane Doe (Resident). Click 'Services' in the navbar.
2. In the search box, click 'AI Smart Matcher Search' to toggle the AI-assisted search mode.
3. In the search input field, type: 'My kitchen sink is leaking heavily and water is running. I need someone this Saturday afternoon.'
4. Click 'Match' and wait for the OpenAI recommendations to load.
5. Point out the ranked recommendation card for Hassan Syed (Verified) and read the AI Match Explanation block.
6. Go back to standard categories, click 'Home Repair', and click on Hassan Syed's card.
7. Highlight the 'AI-Generated Trust Profile' box (Reliability Score: 98/100, Positive Themes, complaints, and summary).
8. Click 'Book Provider'. Select Date: '2026-07-18', Time: '15:00', Description: 'Water leaking under kitchen sink'. Click 'Submit Request'.

SPOKEN SCRIPT & DIALOGUE (ROMAN URDU):

"Shukriya, [Presenter 1]. Main abhi Jane Doe ka role play kar raha hoon. Jab kisi resident ko ghar ke kaamon ke liye help chahiye hoti hai, to sahi provider dhoondna kafi mushkil hota hai. Is problem ko solve karne ke liye hum ne natural language AI Smart Matcher banaya hai.

Yahan main apni problem input karoon ga, jaise ke: 'Saturday afternoon ko kitchen ka sink leak ho raha hai aur paani beh raha hai.' Backend par hamara NestJS server local area ke saare providers, un ki categories, bio description, rating, aur availability ko fetch kar ke GPT-4o ko context ke taur par bhejta hai. AI is request ko analyze karta hai, matching score ke mutabiq providers ko rank karta hai, aur un ki recommendation ki detail wajah batata hai. Jaise aap dekh sakte hain, Hassan Syed ko top par show kiya gaya hai kyunke wo Saturday ko available hain aur plumbing ka kaam karte hain.

Booking se pehle main Hassan ka profile check kar sakta hoon. Dher saare reviews parhne ke bajaye hamara AI Review Sentiment Analyser reviews ko analyze kar ke aik structured trust profile bana deta hai, jis mein Reliability Score (98/100), key themes (jaise 'Punctual', 'Clean'), aur reviews ki do-lines summary shamil hai.

Ye matching bilkul sahi hai, is liye main Saturday ke liye booking request submit karoon ga. Submit karte hi real-time WebSocket notification Hassan ke dashboard par chala jata hai. Ab main [Presenter 3's Name] ko invite karoon ga jo aap ko dikhayein ge ke Hassan kaise apna profile aur service listing AI ke zariye manage karta hai."

TECHNICAL KEYWORDS & SLIDES FOCUS:

- Smart matcher query is sent to a secure backend controller (/ai/match) keeping API keys secure.
- AI Review Sentiment Analyser requires a minimum of 3 reviews to trigger, otherwise degrading gracefully to raw averages.

SCREEN ACTIONS & LIVE NAVIGATION (ENGLISH):

1. Click the Demo switcher and select Hassan Syed (Provider). Click 'Profile' in the navbar.
2. Point out the provider profile completeness score, stats (Response rate, Average response time), and active service listings.
3. Click 'Edit Profile' to open the profile details dialog.
4. Click the 'AI Enhancer Listing' button.
5. Select Category: 'Home Repair'.
6. In Rough Description, type: 'i do simple wires fixing, sockets installs, and domestic plug repairs'.
7. In USPs, type: '5 years experience, free estimations, no mess left'.
8. Click 'Optimize Listing' and wait for the optimized copy to generate in the preview.
9. Click 'Apply and Use Description' and click 'Save'.

SPOKEN SCRIPT & DIALOGUE (ROMAN URDU):

"Shukriya, [Presenter 2]. Main abhi Hassan Syed (Provider) ke role mein hoon. Providers ke liye aksar apne profile par professional aur search-optimized service description likhna kafi mushkil hota hai.

Is mushkil ko hal karne ke liye hum ne AI Listing Description Enhancer banaya hai. Main apne profile edit section mein ja kar 'Home Repair' category select karoon ga, aur aik simple language mein likhoon ga ke main socket lagane aur domestic wiring ka kaam karta hoon aur mere paas 5 saal ka experience hai. Jab main optimize par click karoon ga, backend se AI copywriter hume aik structured JSON layout generate kar ke de ga, jis mein summary, inclusion list, expectations, aur call-to-action details shamil hongi. Main is ko apply karoon ga aur mera profile bio instantly update ho jaye ga.

Ab main [Presenter 4's Name] ko hand over karoon ga, jo aap ko work orders pipeline aur resident ke sath communication flow dikhayein ge."

TECHNICAL KEYWORDS & SLIDES FOCUS:

- AI listing enhancer output schema validation using Zod/TypeScript guards on the NestJS proxy layer.
- Statistics dashboard on the profile page dynamically computes response rates based on live socket messaging data.

SCREEN ACTIONS & LIVE NAVIGATION (ENGLISH):

1. Stay logged in as Hassan Syed (Provider).
2. Go to Messages in the navbar and select Jane Doe's chat thread.
3. In the input box, type a message attempting to bypass the platform: 'Hi Jane, let's do this offline. Please pay me cash or Venmo me at hassan-syed-99. Or call me at 555-1234.'
4. Click Send and point to the red Security Warning Toast and red warning text in the chat bubble.
5. Go to Work Orders (My Requests). Locate Jane Doe's plumbing fix booking.
6. Click 'Accept Order' (Booking shifts to Accepted).
7. Click 'Start Work' (Booking shifts to In Progress).
8. Finally, click 'Mark Completed' (Booking shifts to Completed).
9. Observe the real-time WebSocket state notification toasts.

SPOKEN SCRIPT & DIALOGUE (ROMAN URDU):

"Shukriya, [Presenter 3]. Main abhi Hassan Syed ke taur par hi carry out karoon ga. Chalein hum Messages screen khol kar Jane Doe se chat karte hain.

Platform transaction security ke liye hum ne backend par real-time safety audit engine lagaya hai. Agar main chat mein apna contact number likhoon ya cash, Venmo ya offline payment ki baat karoon, to hamara server is ko flag kar deta hai aur frontend par user ko red warning show ho jati hai ke off-platform transactions se gurez karein, ta ke platform revenue aur security maintain rahe.

Ab main Work Orders par ja kar Jane ki request accept karoon ga. Humare pipeline mein proper state transitions hoti hain. Pehle main order accept karoon ga, phir kaam start kar ke status ko 'In Progress' karoon ga, aur end par 'Completed' mark karoon ga. In status transitions ke instant notifications Jane ko WebSocket ke zariye real-time mein toast updates ki surat mein milte hain.

Ab main [Presenter 5's Name] ko hand over karoon ga, jo humein moderator dispute mediation aur admin settings dikhayein ge."

TECHNICAL KEYWORDS & SLIDES FOCUS:

- WebSocket messages are audited on the fly inside the NestJS Gateway (messaging.service.ts) before database insertion.
- Status transitions are broadcasted live to the other party's browser using custom Socket.io room events.

SCREEN ACTIONS & LIVE NAVIGATION (ENGLISH):

1. Click the Demo switcher and select Jane Doe (Resident). Go to 'My Requests'.
2. Locate the completed Plumbing Fix card. Click the red 'Dispute Job' button.
3. Input Complaint: 'Hassan marked the job completed but my kitchen sink is still leaking water. He left without fixing the pipes!'
4. Input Evidence: 'http://localhost:5173/leaking-sink.jpg' and click 'Open Dispute'.
5. Switch identity to Clara Vance (Moderator). Go to 'Moderator' tab.
6. Click 'Unassigned' tab in sidebar, find the new dispute, and click 'Assign to me'.
7. Select the case from 'My Cases'. Click 'Analyze Case' in the AI Dispute Mediator block.
8. Review AI suggested option (Full Refund) and click '100% Full Refund'.
9. Switch to Alex Johnson (Admin). Click 'Admin' in navbar. Review charts.
10. Click 'Approve Verification' in verification queue. Configure new zone: 'Zone F (Suburbs)' and click 'Add Zone'.

SPOKEN SCRIPT & DIALOGUE (ROMAN URDU):

"Shukriya, [Presenter 4]. Main abhi Jane Doe (Resident) ke role mein switch karta hoon. Jab actual service mein koi problem ho, to hum dispute open kar sakte hain. Hassan ne status completed kar diya hai, lekin paani abhi bhi leak ho raha hai. Jane ab dispute raise kare gi.

Jane apni complaint aur evidence ka link enter kar ke dispute open kare gi. Is se booking status instantly 'Disputed' ho jaye ga aur moderator ko real-time socket notification chala ya jaye ga.

Ab main Moderator Clara Vance ke identity mein switch kar ke Moderator Dashboard par jaon ga. Unassigned case ko main apne upar assign karoon ga. Yahan mujhe complaint, evidence links, aur in dono ki complete chat history show ho rahi hai, jis mein flagged bypass messages bhi shamil hain.

Apne decision ko support karne ke liye, main AI Dispute Mediator Assistant run karoon ga. AI dispute records, statements, aur chat logs ko parh kar contradictions ko highlight karta hai, jaise ke provider work completion ka keh raha hai jabke resident water damage show kar raha hai. AI platform policy ke mutabiq full refund recommend karta hai kyunke provider ne contact details bypass karne ki koshish ki thi. Main click kar ke 'Full Refund' option select karoon ga. Dispute resolve ho jaye ga aur dono parties ko un ke requests screen par resolution show ho jaye gi.

Aakhir mein hum Administrator Alex Johnson ke account par switch kar ke Admin Console dekhein ge. Yahan hum platform analytics aur stats graphs (Booking Volume, Retention, aur Disputes) dekh sakte hain. Admins provider verification documents check kar ke verify kar sakte hain aur new housing zones add kar sakte hain. Main yahan pending provider verify karoon ga aur Zone F add karoon ga jo direct PostgreSQL database mein update ho ga.

Mukhtasar ye ke Neighbours Hub aik secure, modern aur advanced neighborhood marketplace hai. Hum ne is demo mein multi-role workflows, real-time message auditing, aur AI integrations ka successful demo diya hai. Hamari live demonstration yahan ikhtitam-pazir hoti hai. Bohot shukriya, aur ab aap sawalat pooch sakte hain."

TECHNICAL KEYWORDS & SLIDES FOCUS:

- AI Mediator uses a comprehensive multi-variable prompt analyzing both parties' inputs and chat history logs.
- Admin charts are rendered dynamically using Chart.js based on real relational queries from PostgreSQL.

Neighbours Hub - Q&A / Viva Cheat Sheet

Q: Where are the AI APIs handled?

A: All AI prompts are built and sent via the NestJS Backend (ai.service.ts). This is an architecture constraint to keep API keys secure and separate from the React client.

Q: How does real-time communication work?

A: We use socket.io rooms. When users log in, they join a socket room matching their userId and another matching their role. Events like new_message, booking_update, and new_dispute are targeted to specific rooms.

Q: What happens if the OpenAI API goes down or exceeds its limit?

A: We built a local fallback engine. For the Matcher, it uses category string matching. For review analysis, it uses regex keywords. For the Dispute Assistant, it routes based on words like 'leak' (Full Refund) or 'late' (No Action).

Q: How is database referential integrity maintained?

A: Relational integrity is enforced using PostgreSQL foreign keys. We use Prisma schema decorators like onDelete: Cascade so that removing a user cleans up related messages, bookings, and disputes.
